

CREATING FAMILIES AROUND THE WORLD

Institut Marquès: Exzellenz in
Reproduktions-medicin

institut marquès

100 Jahre gynäkologische Kompetenz in Barcelona

Mit 100 Jahren Geschichte bietet **Institut Marquès die besten Behandlungen in der assistierten Reproduktion** an – mit **modernster Technologie** und einem individuellen Service, der **auf die Bedürfnisse jeder Patientin zugeschnitten ist**

Institut Marquès verdankt seinen Namen der Familie, deren Mitglieder über Generationen hinweg die Einheit und Kontinuität des Zentrums geprägt haben. Der Gründer, Dr. Vicens Marquès (1895–1977), war der erste einer Familie von Gynäkologen, die heute in der vierten Generation tätig ist. Er legte den Grundstein für die Familientradition und die Berufung zum Dienst am Patienten – eine Philosophie, die unter der heutigen Leitung von Dr. Borja Marquès weiterhin Bestand hat.

eute sind wir ein international anerkanntes Zentrum für Reproduktionsmedizin. Der Hauptsitz von Institut Marquès befindet sich in Barcelona, der Hauptstadt der Reproduktionsmedizin, und unsere Kliniken sind darauf ausgelegt, werdenden Eltern eine individuell abgestimmte Erfahrung zu bieten.

Wir verfügen über Standorte in Barcelona, Sabadell, Rom und Mailand.

Warum Institut Marquès?

Transparenz und Garantie

Wir halten unsere Verpflichtungen und Ziele ein. Wir garantieren keine Schwangerschaften – wir garantieren exzellente Arbeit und kontinuierliche Innovation. Von Anfang an analysieren wir gemeinsam mit jeder Patientin ehrlich und transparent die besten Alternativen, Behandlungen und Techniken für ihre individuelle Situation. Unser Ziel ist stets Exzellenz.

Patient Centric

Each patient is unique. We offer a tailor-made treatment, a warm and personal human touch. Each patient has their lead Gynaecologist responsible for their entire process, as well as their own Medical Assistant (MA), Personal Assistant (PA) for non-medical matters, and Embryologist. Communication with the patient is paramount: we want them to feel heard at all times. That's why we've thought of their comfort, privacy, and safety.

We also have a specialised unit in Oncology and reproduction for patients who want to have a child after cancer.

We Are the Most Awarded Clinic

Institutions and associations from different sectors recognise our work with prestigious awards given for both our medical work and our scientific studies.

“Our mission is to create a world where every person has the freedom to create a family.”

By your side, even from a distance

We are pioneers in the Remote Egg Donation programme, which we are successfully implementing with other centres. These centres ship the frozen semen to Institut Marquès where we perform IVF with donor eggs. The embryos are then shipped back to the centre for transfer. This way patients do not have to travel to fulfill their dream.

Male Factor Study

Very few centres have their own Andrology unit and deeply assess the male factor in diagnosis. We can prevent 50% of failures in IVF cycles with egg donation thanks to the study of male fertility.

Technology and Safety

We boast state-of-the-art laboratories, the best team of biologists, and follow strict safety and quality protocols in all our centres. We also offer the best add-on techniques. We choose for each patient the techniques that will help them achieve the goal of having a child: Pre-implantation Genetic Testing (PGT), ICSI, IMSI, Fertile, etc.

Own Gamete Bank

We have our own donor bank, both for eggs and sperm, to always find the best donor for each patient.

Research and Development

We stand out from other centres: we are proactive professionals constantly seeking improvement and excellence. We have a Scientific Committee and present our findings at the most important national and international congresses. We also offer courses and training at our facilities.

OUR CENTRES

Present in Spain (Barcelona and Sabadell) and Italy (Milan and Rome), Institut Marquès is an international reference centre in Gynaecology and Assisted Reproduction. With around two hundred professionals working as a team, it offers personalised care in each patient's language, without waiting lists and 365 days a year.

All our specialists coordinate to provide a service that combines medical excellence, the latest technology and the most avant-garde diagnostic and treatment methods.

Barcelona: a unique clinic

In a clinic that defies all conventions in terms of design, the latest technologies, care, and services, patients find a warm and welcoming environment: a truly unique experience for future parents. It offers an open and free space that welcomes visitors as if entering a "town square" for a stroll. In Plaza Marquès, one can grab a refreshment, work in the "Working Area", or relax in the "Chill out" corner.

Patients can fully personalise a special moment, that of the embryo transfer. For this, they will find a wide range of special and à la carte services:

- Relaxing massage and acupuncture, either before or after the transfer.
- A private space that can be booked by the hour to replace the hotel during the day.
- Pick-up from the airport for our foreign patients.

TECHNOLOGY AND INNOVATION

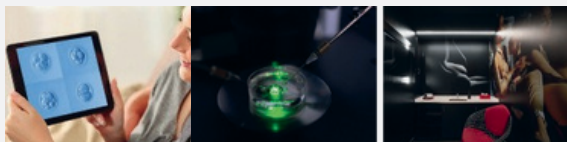

At Institut Marquès, we use the finest technologies for the benefit and well-being of our patients and to refine Assisted Reproduction techniques..

Our laboratories are equipped with the latest advancements in Medicine and Reproductive Biology, allowing the selection of the best oocytes, sperm, and embryos to achieve pregnancy:

Embryomobile: We have developed a new system that allows patients (and their doctors) to monitor the development of their embryos, no matter where they are. The Embryomobile enables online connection to the Embryoscope (an incubator with cameras), exemplifying transparency in our way of working.

Preimplantation Genetic Diagnosis (PGT): This technique facilitates the detection of genetic diseases in the embryo, allowing the best one to be transferred. At Institut Marquès, we are international leaders in PGT; we use the most innovative method currently employed in the genetic diagnosis of embryos.

Erotic Personal System: We have transformed our sample collection rooms into a comfortable and special space where men can feel as relaxed as possible, achieving maximum arousal before ejaculation. A programme created to enhance male satisfaction during the Assisted Reproduction process and obtain the best possible semen sample.

TREATMENTS

We have the best professionals and use the most advanced reproductive technology. Thanks to this, we achieve the highest success rates in the sector.

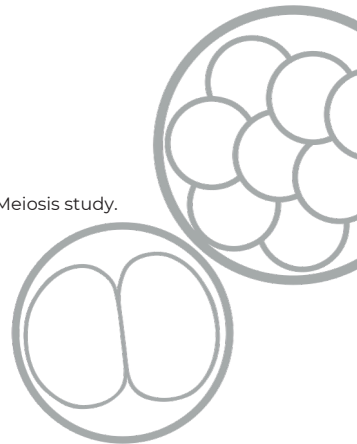

We transfer a single embryo on the fifth day of culture (blastocyst). This technique increases the implantation rate and reduces the percentage of multiple pregnancies.

- Artificial Insemination (with partner's or donor sperm)
- In Vitro Fertilisation with Own Eggs (with partner's or donor sperm)
- In Vitro Fertilisation with Egg Donation (with partner's or donor sperm)
- Embryo Adoption/Donation
- ROPA Method for Lesbian Couples (Reciprocal IVF)
- Egg Vitrification and Semen Freezing

"Just for transfer": In this case, frozen semen is shipped to Institut Marquès for IVF. The patient only needs to visit our clinic on the day of the embryo transfer. In collaboration with other centres for IVF treatments with egg donation

TECHNIQUES

- ICSI (all our treatments are carried out using this technique)
- Timelapse Incubators (Embryoscope)
- IMSI
- Fertile
- Chip
- DNA Fragmentation
- Polaraide
- Assisted Hatching
- Genetic studies
- FISH
- Testicular biopsy for Meiosis study.
- TESA TESE

EGG AND SPERM DONATION

Egg donation is the Assisted Reproduction technique with the highest pregnancy rate per cycle. Our success rate in IVF with egg donation and donor sperm stands at 91.5%. (Accredited by the Spanish Fertility Society SEF).

We select our donors based on the phenotype and blood group of the persons/people who require them; and now also considering psychological traits, thanks to our personality matching.

Patients can learn certain characteristics of the donor. However, according to Spanish law, their identity remains anonymous: donors will not have access to the identity of any babies born from their gametes. Similarly, none of these babies will know the identity of the donor.

Donors must be physically and mentally healthy with no history of hereditary diseases in their family. After an interview where information about their medical history and family history is requested, donors undergo a medical examination that includes blood tests, pelvic ultrasound and vaginal cultures, karyotype test and other tests to exclude possible infectious diseases. (Tests to rule out mutations and the most common genetic diseases are also performed).

We offer the possibility to extend to 420 genes in case you want to perform "genetic matching".

EMBRYO DONATION

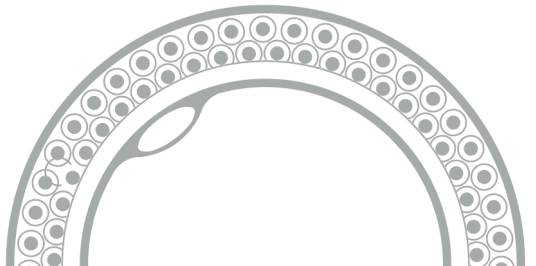

In 2004, Institut Marquès decided that the embryos legally under its care could have a chance at life. This led to the inception of a pioneering project that remains the most extensive of its kind in the world. Thanks to this programme, over 2,000 children have already been born.*

Our embryo donation programme

The embryos in our donation programme come from couples who have explicitly and in writing donated their embryos to other couples. In the case of the adoption programme, the couples have not made a decision about the future of their embryos and, according to the Spanish Assisted Reproduction law, these become the responsibility of the centre.

These embryos come from healthy couples under 35 who have successfully undergone IVF treatment (with oocytes from women under 35 years old) and have decided not to have more children. These embryos often come from egg and/or sperm donations.

*We have specific protocols to review all medical data, history and quality of each embryo before it can enter the adoption or donation programme.

RAINBOW FERTILITY BARCELONA

Assisted Reproduction for LGTBIQ+ people

Rainbow Fertility Barcelona is a project of Institut Marquès, with which we want to continue helping even more LGTBIQ+, lesbian, gay, bisexual, transgender, intersex people, as well as other sexual and gender diversities, to achieve their dream of having a family.

- We want to guarantee good practices for the treatment of sexual, gender and family diversity in all our activities, as a company and, of course, in terms of care with our patients.
- We want to create a respectful and pleasant space so that the LGTBIQ+ community feels vindicated and welcomed during their treatment.
- We want to make the presence of LGTBIQ+ people even more visible and normalize in our daily lives: Their invisibility is also a form of discrimination.
- We want to eliminate prejudices and stereotypes.
- We want to accompany our patients throughout the entire process: we include pregnancy monitoring until the eighth week.

Reproductive Medicine offers different possibilities to LGTBIQ+ people. Choosing the most appropriate treatment depends, among other things, on the situation of each patient: what gametes they have (eggs or sperm), their fertility and whether they have a partner with whom they share their family project.

In Spain, surrogacy is not legal.

Our treatments

ARTIFICIAL INSEMINATION

Preparation of the sperm sample for insemination.

ARTIFICIAL INSEMINATION WITH DONOR

Donor selection.

Preparation of sperm sample for insemination

HOMOLOGOUS IN-VITRO FERTILISATION + ICSI

Egg retrieval and medical check-up.

In Vitro fertilisation and sperm microinjection (ICSI).

Embryo transfer.

MINI IVF – NATURAL CYCLE + ICSI

Egg retrieval and medical check-up.

In Vitro fertilisation and sperm microinjection (ICSI).

Embryo transfer.

EGG DONATION

Donor selection and egg retrieval.

In Vitro fertilisation and sperm microinjection (ICSI).

Embryo transfer.

ALL-INCLUSIVE EGG DONATION 1

Guarantee of one high-quality blastocyst (day 5 embryo).

Time-lapse incubator and Embromobile

Medication for the donor.

ALL-INCLUSIVE EGG DONATION 2

Guarantee of two high-quality blastocysts (day 5 embryo).

Time-lapse incubator and Embromobile

Medication for the donor.

EGG DONATION

(Guarantee for 1 Euploid Blastocyst)

Egg donation and medical coordination.

In Vitro fertilisation, sperm microinjection (ICSI) and genetic testing (PGT).

Transfer of a high-quality euploid blastocyst.

EMBRYO DONATION

Embryo selection.

Culture up to day 5 (blastocyst).

Embryo transfer.

ROPA METHOD

Ovarian stimulation and endometrial preparation.

Egg retrieval and medical check-up.

In Vitro fertilisation and sperm microinjection (ICSI).

Embryo transfer.

EGG FREEZING

Egg retrieval and medical check-up.

Laboratory services for in vitro fertilisation.

Vitrification of oocytes and 2-year storage of frozen oocytes.

EGG FREEZING (2-PACK)

It includes the first three years of oocyte maintenance.

IVF TANDEM

(Homologous IVF + egg donation package)

It includes a cycle of in vitro fertilisation with your own eggs and the preparation of a donor at the same time.

In this way, we always offer the possibility of an embryo transfer without a waiting period.

Time-lapse incubator.

Embryo transfer on day 5 (blastocyst).
